Milagro Oil Extract for the treatment of cancer and reduction of associated symptoms  
Valerie Leveroni Corral  
Wo/Men’s Alliance for Medical Marijuana (WAMM), Director

WAMM was founded in 1993 and is the longest running medical marijuana collective in the United States. Our unique model is patient centric, building upon many aspects of service by providing hope, building community and offering organic, medical marijuana medicine on a donation basis. WAMM has emerged as a unique model, a patient self-help alliance alternative to the illicit black market. The inherent value of this prodigious medicine can be measured in its ability to affect a myriad of symptoms, providing powerful relief with few side effects.

Within the seriously ill population of the WAMM community, patients are driven to reduce suffering. For a myriad of reasons they may seek alternatives to allopathic drugs. This particular cannabis medicine may be used as a primary or adjunct means of treatment. Data collected from our members regarding the efficacy of WAMM’s exclusive, laboratory tested varieties and their measured effects on different symptoms guide our production of quality medicine specific for symptomatic relief. Below find a synopsis of the recent findings of our whole cannabis plant extract. This extract (oil) is known as Milagro Oil extract and I will refer to the whole plant extract as such in the following paragraphs.

The Purpose of this Study
The primary purpose for this study is to assess the relief of suffering in patients suffering from acute illness and to appraise the potential of cannabis to concurrently promote cell survival and cell death. While the mechanism for this binary role remains unclear, balancing the growth and inhibitory factors in healthy tissues as a function of autophagy as affected by cannabis may prove an effective therapeutic strategy for targeting human cancers.

Preparation
The data has been collected from seven patients; each began with the ingestion of a decoction of Milagro Oil extract blended into organic hemp seed oil. The Milagro Oil extract is prepared from a blend of different varieties of organic C.sativa and C.indica, including the principal parts of the plant; the small and some fan leaves, whole flowers of varying degree of maturity, axillary buds, leaf primordia & the shoot apex, and small stems which include the vascular tissue. One pound (453.5g) of dry medical marijuana will produce approximately two ounces (50-60 ml.) of organic, high-grade oil, depending on the method of extraction and reclamation of the ethanol used in the preparation.

The oil is made in an apparatus based on a modified Soxhlet design. A10-gallon pot with a water chilled coldfinger/condenser for a lid. Amaterial basket is suspended below the coldfinger and above the active solvent level. I grind all material into a homogenous mix about the consistency of sawdust. The entire material except for stems, stalks and roots are used from plants that have come to full maturity and potency. This is then loaded into a material basket. The initial working solvent is added to the kettle. (about 7-8 liters)

As heat is applied – the solvent boils and the resulting alcohol vapors are condensed on the surface of the condenser and re-deposited onto the material basket where it continues leaching oil from material and back into reservoir as an oil/solvent mix. After a while the material basket is swapped out with fresh material and additional fresh solvent is added to replace solvent lost or absorbed by previous basket. The old/consumed material is completely

https://www.wamm.org
brown at this point – leached of pretty much everything but cellulose. This is repeated up to 4-5 times (basket changes) with 2 liters of solvent being added each time as well. (A constant reservoir level of around 8 liters can absorb all the oil from 4+ kilos of cannabis before it all starts making a mess.) Next – the oil-alcohol mix is filtered through filter paper while it is still warm.

Reduction: I reduce the oil to remove all traces of solvent while watching temperature carefully. After alcohol has been vaporized off (180 deg f.) the water now reduces off as the temperature rises above 215 deg f. The oil is heated further to 260 deg f to insure all solvent and water has been purged. It is then left to cool.

After it has cooled – the only further refining is to remove a thin layer of wax that forms at the top after it has cooled.

Administration

The average patient will consume 60-grams of Milagro Oil extract in 90 days to complete one full treatment. In order for a patient new to this process, to adequately ingest this potent medicine, I make a decoction of organic Milagro Oil extract blended into organic hemp seed oil at a ratio of 1 to 10. We call this Milagro H/Oil to distinguish it from the pure extract, Milagro Oil. The Milagro Oil extract & the decoction of Milagro H/Oil are drawn into syringes that are capped to avoid leakage. The Milagro H/Oil decoction provides a medicine that a patient can easily titrate until which time a measurable amount of pure extract Milagro Oil is tolerated.

To begin, patients orally ingest daily doses of Milagro H/Oil. A 1.0ml. syringe contains 0.1ml. of Milagro Oil extract infused in a hempseed oil decoction. A patient will ingest a few drops to a dropper full, administered 3-4 times daily for the first 4-5 days, increasing pro re nata, as tolerated. After this initial period, patients begin with a drop of pure Milagro Oil extract administered two times daily, increasing as tolerated. Increase every four days until reaching the target goal of 1.0ml (1gram) Milagro Oil extract each day, until a total of 60 grams has been consumed within 90 days. The treatment is complete at the end of the 90-day period. It is advisable to continue to ingest a therapeutic dose of 1.0gr per month to maintain healthy cells.

The amount of Milagro Oil extract that a patient can initially ingest varies from patient to patient and does not appear to be linked to body weight, but rather may be affected by the progression of symptoms and the cannabinoid system of each patient.
